Angular Component Workshop

Vers. 1.0.0 / Oktober 2018

Autoren:
Thomas Huber, Thomas Gassmann, Thomas Bandixen

Course Content

00_Course Introduction	3
01_Angular Components	9
02_Communicating with a Template.....	22
03_Input and Output Decorators	27
04_ViewChild_ViewChildren.....	36
05_Communication through a Service	41
06_Component Architecture	61
07_Angular Elements.....	65
08_Course Outro.....	82

The banner features a superhero in a suit pulling back his shirt to reveal a red chest with a white Angular logo (a stylized 'A'). The background is a city skyline at sunset. Below the superhero, the text reads "Angular Components Workshop" and "Thomas Gassmann (@gassmannT)". To the right, there's a small superhero icon with the letter 'A' on its chest, standing next to a diamond-shaped badge with three stars.

Angular Components Workshop

Thomas Gassmann (@gassmannT)

HAMBURG • COPENHAGEN • LAUSANNE • MUNICH • STUTTGART • VIENNA • ZURICH

trivadis
makes IT easier. ■ ■ ■

■ Why a Workshop about Angular Components

- Components are a core concept of Angular
- There are plenty of ways how to communicate with Components
- With a some tricks, the code, testability and performance can be improved

■ Your Trainer

Thomas Gassmann

Senior Consultant, Trainer, Speaker

thomasgassmann.net
[@gassmannT](https://twitter.com/gassmannT)
thomas.gassmann@trivadis.com

3 10/17/2018 Angular Component Workshop

■ Your Trainers

4 10/17/2018 Angular Component Workshop

■ Course Hours

- Official course hours
 - 09:00 – 10:30
 - 10:45 – 12:00
 - 13:00 – 14:30
 - 15:00 – 17:00
- If you need a break in between, feel free to ask

5 10/17/2018 Angular Component Workshop

■ Course Planning

- **Angular Component Workshop**
 - Introduction to Angular Components
 - Communicating with a Template
 - Input and Output Decorators
 - ViewChild and ViewChildren Decorators
 - Communication through a service
 - Architecture
 - Angular Elements

6 10/17/2018 Angular Component Workshop

■ Introduce Yourself

- Name and job description
- Experience with Angular / TypeScript / JavaScript
- Experience with VSCode
- Expectations for this course

7 10/17/2018 Angular Component Workshop

■ Your machine

- Visual Studio Code
 - Microsoft's powerful cross-platform code editor
- Node.js and NPM
 - powerful server and package manager
- Sample-code:
 - Structured like modules in this course
 - Available on
 - <https://github.com/AngularAtTrivadis/AngularComponentWorkshop>

8 10/17/2018 Angular Component Workshop

■ Your machine

■ Install Angular CLI

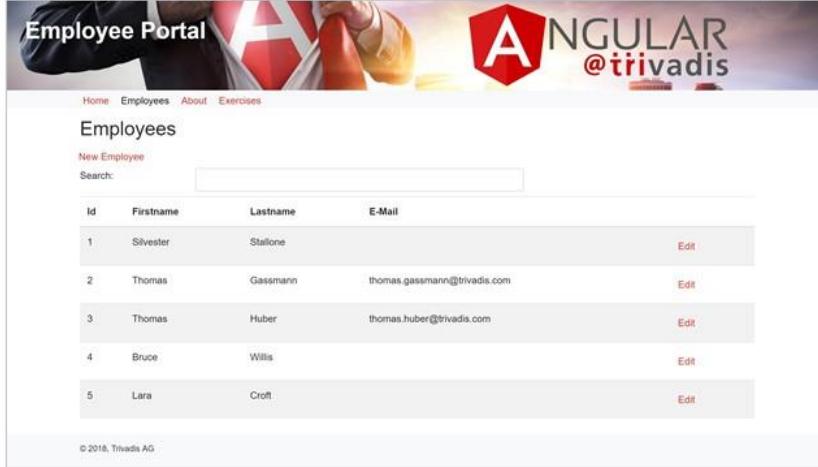

```
npm install -g @angular/cli
```

■ VS Code Extension

- Angular@Trivadis VS Code Essentials
- https://marketplace.visualstudio.com/items?itemName=trivadis.ngt_vd-extensions

■ What are we building?

■ Extend an existing application with different component mechanisms

The screenshot shows a web application titled "Employee Portal" with a banner for "ANGULAR @trivadis". The main page is titled "Employees" and displays a table of employee data. The table has columns for Id, Firstname, Lastname, and E-Mail. The data is as follows:

Id	Firstname	Lastname	E-Mail	Action
1	Silvester	Stallone		Edit
2	Thomas	Gassmann	thomas.gassmann@trivadis.com	Edit
3	Thomas	Huber	thomas.huber@trivadis.com	Edit
4	Bruce	Willis		Edit
5	Lara	Croft		Edit

At the bottom left, it says "© 2018, Trivadis AG".

Let's get our hands dirty!

11 10/17/2018 Angular Component Workshop

Angular: Components

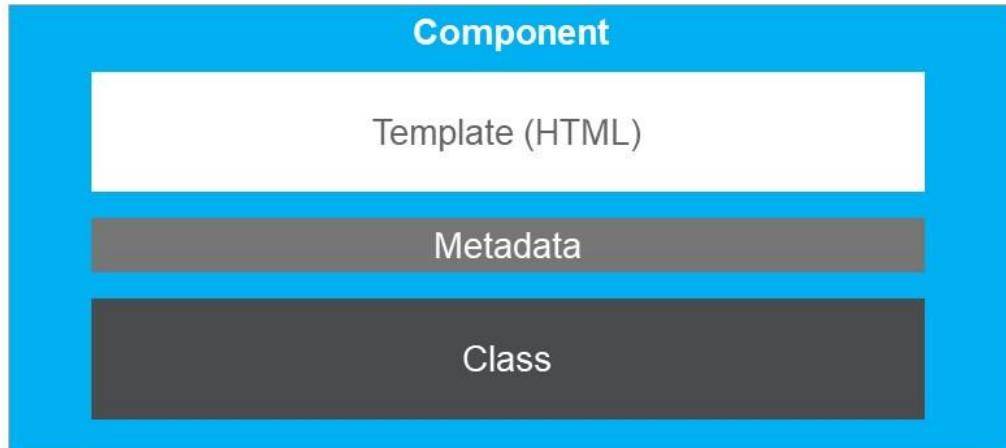

Thomas Claudius Huber
Thomas Bandixen
Thomas Gassmann

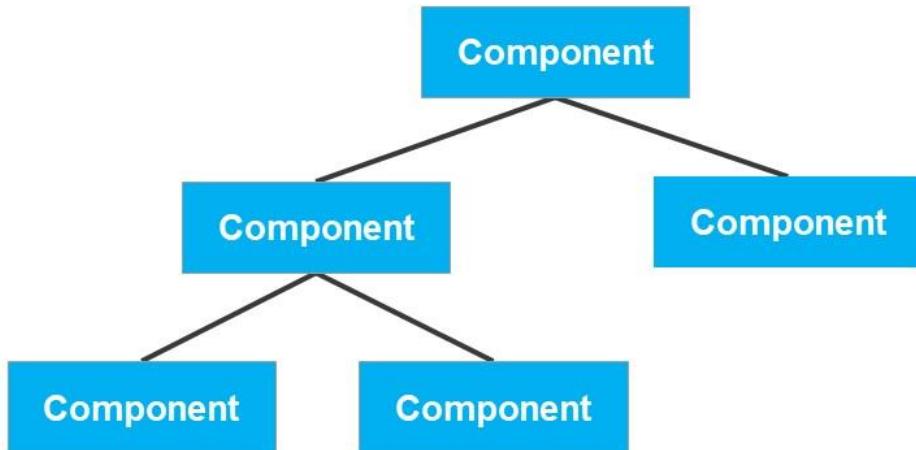

BASLE • BERN • BRUGG • DÜSSELDORF • FRANKFURT A.M. • FREIBURG I.BR. • GENEVA
HAMBURG • COPENHAGEN • LAUSANNE • MUNICH • STUTTGART • VIENNA • ZURICH

trivadis
makes **IT** easier. ■ ■ ■

- All Angular Apps are component-based

- An Angular app is a tree of components

3 10/17/2018 Angular Component Workshop

- Define a PersonDetailComponent

AppComponent

- Displays a list of persons
- Displays the details of the selected person
- Lets move the detail-display to a separate component

PersonDetailComponent (person-detail.component.ts)

CLI: `ng g component person-detail`

4 10/17/2018 Angular Component Workshop

■ Define a PersonDetailComponent

```
import { Component } from '@angular/core';
import { Person } from './person';

@Component({
    selector: 'person-detail',
    template: ` ...
        <input id="firstname" type="text"
            [(ngModel)]="person.firstname"/> ...
    `
}
)
export class PersonDetailComponent {
    person: Person;
}
```

5 10/17/2018 Angular Component Workshop

■ Declare it in the AppModule

```
...
import {PersonDetailComponent} from './person-detail.component';

@NgModule({
    imports: [BrowserModule, FormsModule],
    declarations: [AppComponent, PersonDetailComponent],
    bootstrap: [AppComponent]
})
export class AppModule { }
```

6 10/17/2018 Angular Component Workshop

■ Use it in the AppComponent

- Just use the chosen selector «person-detail»

```
<person-detail></person-detail>
```

7 10/17/2018 Angular Component Workshop

■ Ways to define a Component's template

- Inline via template-property

```
@Component({  
  selector: 'my-app',  
  template: '<h1>Hello</h1>'  
})
```

- Linked via templateUrl-property

```
@Component({  
  selector: 'my-app',  
  templateUrl: '/app/app.component.html'  
})
```

8 10/17/2018 Angular Component Workshop

■ Ways to define a Component's styles

- Inline via styles-property

```
@Component({  
  selector: 'my-app',  
  styles: ['.isSelected{ color:green }']  
})
```

- Linked via styleUrls-property

```
@Component({  
  selector: 'my-app',  
  styleUrls: ['/app/app.component.css']  
})
```

9 10/17/2018 Angular Component Workshop

■ Data Binding overview

- **{}** => Display the value of a property in the UI
- **[]** => Bind an element-property to a property of your class
- **()** => Bind an element-event to a method of your class
- **[]** => Bind a property two-way
 - that you don't have to think whether it's **()** or **[()]**, just use the “banana in a box”-mnemonic to get the syntax right

10 10/17/2018 Angular Component Workshop

■ Simple Rendering with Interpolation

- Use an expression in {{ }}
 - for example {{1 + 1}} will write out 2
- use the pipe iterator to pass the expression to a Pipe
 - you can write your own pipes or use existing pipes like uppercase

```
@Component({
  selector: 'my-app',
  template: `<h1>Details of {{fullname | uppercase}}</h1>`})
export class AppComponent {
  fullname: string = "Lara Croft";
}
```

11 10/17/2018 Angular Component Workshop

■ Binding properties

- use the brackets [] to bind to a property
- This creates a OneWay-Data Binding

```
@Component({
  selector: 'my-app',
  template: `<h1>Details of {{fullname | uppercase}}</h1>
            <input type="text" [value]="fullname">`
})
export class AppComponent {
  fullname: string = "Lara Croft";
}
```

12 10/17/2018 Angular Component V

Details of LARA CROFT

■ Binding events

- Use parentheses () to bind events to methods

```
@Component({...,  
  template: `...  
    <input type="text" [value]="fullname">  
    <button (click)="onUpdate()">Update</button>  
  `})  
export class AppComponent {  
  fullname: string = "Lara Croft";  
  onUpdate()  
  {  
    this.fullname = "Duke Nukem";  
  }  
}
```

13 10/17/2018 Angular Component Workshop

■ Add the FormsModule to your AppModule

- This allows you to use ngModel for TwoWay-Data Bindings

```
import { NgModule }      from '@angular/core';  
import { BrowserModule } from '@angular/platform-browser';  
import {FormsModule} from '@angular/forms';  
import { AppComponent }  from './app.component';  
  
@NgModule({  
  imports:      [ BrowserModule, FormsModule ],  
  declarations: [ AppComponent ],  
  bootstrap:   [ AppComponent ]  
})  
export class AppModule { }
```

14 10/17/2018 Angular Component Workshop

■ TwoWay-Data Bindings

```
<input type="text"
       [ngModel]="fullname"
       (ngModelChange)="fullname = $event">
```

- You can see above that neither a DOM-property nor a DOM-event is involved => it's pure Angular
- As Angular knows the bound property and the bound event, it has a special shortcut syntax: «the banana in the box»

```
<input type="text"
       [(ngModel)]="fullname">
```

15 10/17/2018 Angular Component Workshop

■ TwoWay-Data Bindings: Binding to an object

- Just use the dot-syntax to access properties

```
@Component({
  selector: 'my-app',
  template: `<h1>Details of {{person.fullname | uppercase}}</h1>
              <input type="text" [(ngModel)]="person.fullname">`
})
export class AppComponent {
  person: Person = { fullname: "Lara Croft" };
}

interface Person { fullname:string }
```

16 10/17/2018 Angular Component Workshop

■ Structural Directives

- **ngFor** – to generate elements while looping over a collection
- **ngIf** – to show or hide an element with an if-statement
- **ngSwitch** – to show/hide elements based on a condition

■ ngFor

```
@Component({...  
  template: `...  
    <table>  
      <tr *ngFor="let person of persons">  
        <td>{{person.firstname}}</td>  
        <td>{{person.lastname}}</td>  
        <td>{{person.githubaccount}}</td>  
      </tr>  
    </table>  
  `)  
}  
export class AppComponent {  
  persons:Person[] = PERSONS;  
}
```

■ **ngIf**

- The div is only displayed if selectedPerson is not undefined/null

```
@Component({...  
  template: `...  
    <div *ngIf="selectedPerson">  
      ...  
    </div>  
  ...  
})  
export class AppComponent {  
  persons:Person[] = PERSONS;  
  selectedPerson:Person; ...  
}
```

19 10/17/2018 Angular Component Workshop

■ **ngIf**

- Since Angular 4 ngIf else can be used for loading messages

```
@Component({...  
  template: `...  
    <div *ngIf="selectedPerson; else loading">  
      ...  
    </div>  
    <ng-template #loading>Loading...</ng-template>  
  ...  
})  
export class AppComponent {  
  persons:Person[] = PERSONS;  
  selectedPerson:Person; ...  
}
```

20 10/17/2018 Angular Component Workshop

■ ngSwitch

- Based on the firstname a div is displayed

```
<div [ngSwitch]="selectedPerson?.firstname">
  <div *ngSwitchCase="'Thomas'">I'm teaching Angular</div>
  <div *ngSwitchCase="'Lara'">I'm playing games</div>
  <div *ngSwitchDefault>I'm just a fallback</div>
</div>
```

■ About stars (*) and templates

- ngFor, ngIf and ngSwitch use a * for the attribute
 - that's Angular's syntactical sugar
- all these directives add/remove a subtree within a template tag
- the template-tag gets generated behind the scenes

■ About stars (*) and templates

- This is what Angular does with an *ngIf

```
<input *ngIf="selectedPerson" .../>
```

```
<input template="ngIf:selectedPerson" .../>
```

```
<ng-template [ngIf]="selectedPerson">
  <input .../>
</ng-template>
```

■ Component Lifecycle Hooks

- You can hook into the life cycle of your component. Just implement these interfaces:
 - **OnInit** - initialize your component and load data
 - **OnChanges** - react to changes of input properties
 - **OnDestroy** – perform cleanup actions

```
import { Component, ..., OnInit } from '@angular/core';

@Component( ... )
export class PersonDetailComponent implements OnInit {
  ngOnInit() { console.log('initialized'); }
}
```

■ Component Lifecycle Hooks

25 10/17/2018 Angular Component Workshop

trivadis
makes IT easier. ■ ■ ■

■ Summary

- Components need to be declared in an app module
- Components have their own HTML-selector
- Lifecycle Hooks are used by implementing their interface

26 10/17/2018 Angular Component Workshop

trivadis
makes IT easier. ■ ■ ■

Communicating with a Template

Thomas Claudius Huber
Thomas Bandixen
Thomas Gassmann

BASLE • BERN • BRUGG • DÜSSELDORF • FRANKFURT A.M. • FREIBURG I.BR. • GENEVA
HAMBURG • COPENHAGEN • LAUSANNE • MUNICH • STUTTGART • VIENNA • ZURICH

trivadis
makes **IT** easier. ■ ■ ■

■ Communication with a Template

- Data Binding
- Structural Directives
- Notifying the Component of User Changes

■ Notifiyng the Component of User Changes

- Two-way Databinding with ngModelChange
- Getter/Setter in Two-way Databinding
- valueChanges observable

3 10/17/2018 Angular Component Workshop

■ Two-way Databinding with ngModelChange

- Normal two-way Databinding

```
<input type="text" [(ngModel)]="listFilter" />
```

- Two-way Databinding, the long form

```
<input type="text" [ngModel]="listFilter"
       (ngModelChange)="listFilter=$event" />
```

- To interact or notify to the change, add a method

```
<input type="text" [ngModel]="listFilter"
       (ngModelChange)="onFilterChange($event)" />
```

4 10/17/2018 Angular Component Workshop

■ Getter/Setter in Two-way Databinding

■ Getter and Setter

```
private _listFilter: string;

get listFilter: string {
    return this._listFilter;
}

set listFilter(value: string) {
    this._listFilter = value;
    // perform filtering or any other action
}
```

5 10/17/2018 Angular Component Workshop

■ Angular Forms

Template-Driven Forms

- Angular creates the form
- Defined in the template
- Access references with ViewChild

Reactive Forms

- We create the form structure
- Define in the component
- No need for ViewChild

6 10/17/2018 Angular Component Workshop

■ ValueChanges observable: Template-Driven

- Even if input is not inside a form, we can access it via ViewChild

```
<input type="text" [(ngModel)]="listFilter" />
```

```
@ViewChild(NgModel) filterInput: NgModel;  
...  
this.filterInput.valueChanges.subscribe(() =>  
    this.performFilter(this.listFilter)  
) ;
```

7 10/17/2018 Angular Component Workshop

■ ValueChanges observable: Reactive Forms

- Subscribe directly to the form control

```
this.filterInput.valueChanges.subscribe(() =>  
    this.performFilter(this.listFilter)  
) ;
```

8 10/17/2018 Angular Component Workshop

■ Summary

- Whenever possible, use bindings and structural directives
- They are simple, common and easy to understand for any other developer on the team
- Avoid using two-way Databinding the long way.
- Getter and Setters are a good alternative but require more lines of code
- Or subscribe to the valueChanges event

9 10/17/2018 Angular Component Workshop

Demo/Excercise

Change listFilter input to the long way of two-way Databinding

Change it to Getter/Setters

10 10/17/2018 Angular Component Workshop

Input and Output Decorators

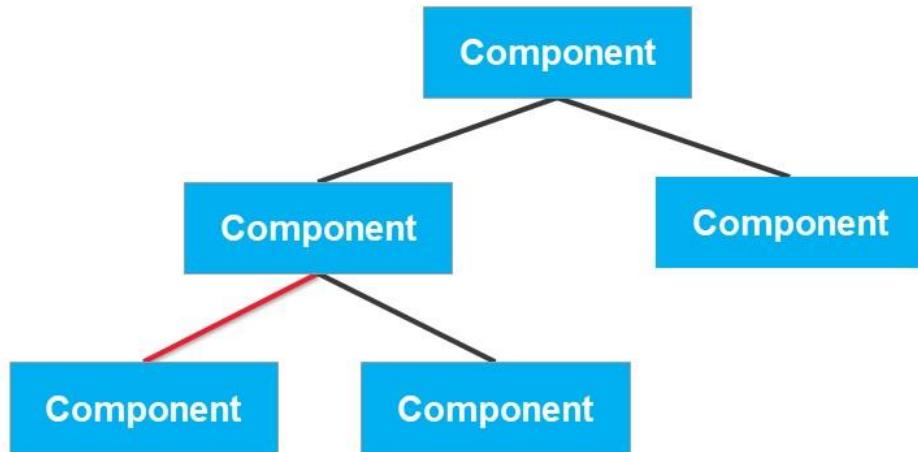

Thomas Claudius Huber
Thomas Bandixen
Thomas Gassmann

BASLE • BERN • BRUGG • DÜSSELDORF • FRANKFURT A.M. • FREIBURG I.BR. • GENEVA
HAMBURG • COPENHAGEN • LAUSANNE • MUNICH • STUTTGART • VIENNA • ZURICH

trivadis
makes **IT** easier. ■ ■ ■

■ Parent to Child Communication

The screenshot shows a web application titled "Employee Portal" with a banner for "ANGULAR @trivadis". The main navigation bar includes links for "Home", "Employees", and "About". Below the navigation, the title "Employees" is displayed. A search bar is present with the placeholder "Search:" and the value "Thomas". A message indicates "Filtered by: Thomas" and "3 hits". A table lists three employee entries:

Id	Firstname	Lastname	E-Mail	Action
3	Thomas	Huber	thomas.huber@trivadis.com	Edit
5	Thomas	Gassmann	thomas.gassmann@trivadis.com	Edit
6	Thomas	Bandixen	thomas.bandixen@trivadis.com	Edit

At the bottom left, there is a copyright notice: "© 2018, Trivadis AG".

■ Parent Child Communication Use Cases

Using an Input property

- Configure the child component (e.g. enable status)
- Provide a default value (e.g. past the last filtered criteria)
- Provide an item data to the child (e.g. edit form)

Request information with a ViewChild decorator or Template Reference Variable

- Poll data from a child
- Tell the child to perform an action

■ Use the Input of a Component

- Existing code «person-detail»

```
<person-detail></person-detail>
```

- Bind the person-property to the selected person

```
<person-detail [person]="selectedPerson"></person-detail>
```

- This leads to an error. The person-property is only available in the PersonDetailComponent's template => Change it

■ The Input of a Component

- Use the @Input decorator

- to make a components property available to the outside
 - this means that you can bind to the property

```
import { Component, Input } from '@angular/core';
import { Person } from './person';

@Component( ... )
export class PersonDetailComponent {
    @Input()
    person: Person;
}
```

■ The Input of a Component

```
@Component( ... )
export class PersonDetailComponent {
  @Input()
  person: Person;
}
```

- With the input defined, this works:

```
<person-detail [person]="selectedPerson"></person-detail>
```

7 10/17/2018 Angular Component Workshop

■ Watching for Changes to an Input Property

- Getter and Setter

```
private _hitCount: Number;
get hitCount(): Number {
  return this._hitCount;
}
@Input()
set hitCount(value: Number) {
  this._hitCount = value;
  // action to do
}
```

8 10/17/2018 Angular Component Workshop

■ Watching for Changes to an Input Property

- OnChanges Lifecycle Hook

```
@Input()  
hitCount: number;  
  
ngOnChanges(changes: SimpleChanges) {  
    if(changes['hitCount'] && !changes['hitCount'].currentValue) {  
        this.message = 'No matches found';  
    } else {  
        this.message = 'Hits: ' + this.hitCount;  
    }  
}
```

9 10/17/2018 Angular Component Workshop

■ Referencing a Child Component

- The parent needs a property from a child component
- Or wants to call a child components method
- Add a Template Reference Variable

```
<app-filter #filterComp  
    [hitCount]="employees?.length" >  
</app-filter>
```

- Now access any information from the child component

```
{{ filterComp.listFilter }}
```

10 10/17/2018 Angular Component Workshop

■ Child to Parent communication use cases

Provide events with an **Output** decorator

- Event notification (e.g. parent needs to know when the `filterValue` changed)

Child component can provide properties and methods and expect the parent component to access it

- Child has data which it wants to provide to the parent (e.g. message for display)

■ Defining Component events

- Use Angular's `EventEmitter`

```
import { Component, Input, EventEmitter } from '@angular/core';

@Component( ... )
export class FilterComponent {
    ...
    valueChange = new EventEmitter<string>();

    onValueChange() {
        this.valueChange.emit(this.filterValue);
    }
}
```

■ The Output of a Component

- To use the event from the outside, define it as Output!

```
import { ..., Output, EventEmitter } from '@angular/core';

@Component( ... )
export class FilterComponent {
  ...
  @Output()
  valueChange = new EventEmitter<string>();
}
```

```
<app-filter [hitCount]="employees?.length"
  (valueChange)="onValueChanged($event)"></app-filter>
```

13 10/17/2018 Angular Component Workshop

■ How to notify when the value change

- For example with Getter/Setter

```
private _filterValue: string;
get filterValue(): string {
  return this._filterValue;
}
set filterValue(value: string) {
  this._filterValue = value;
  this.valueChange.emit(this._filterValue);
}
```

14 10/17/2018 Angular Component Workshop

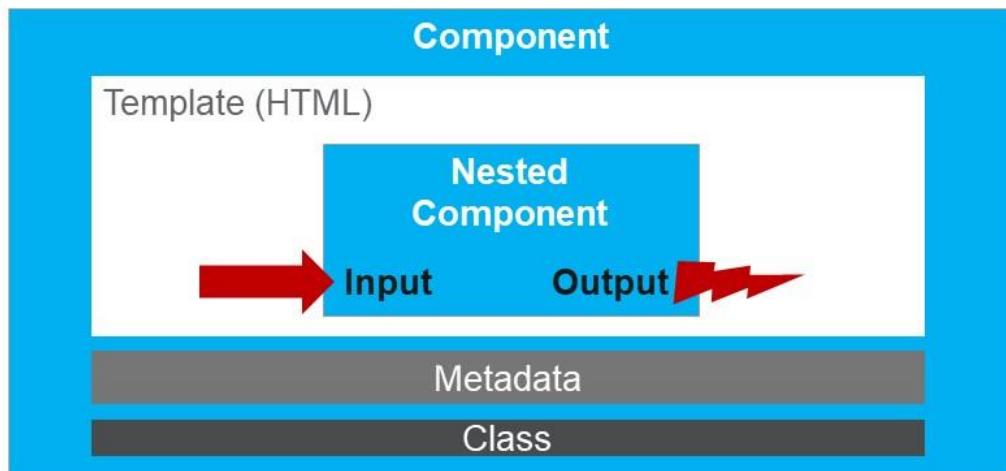

Demo

trivadis
makes **IT** easier. ■ ■ ■

15 10/17/2018 Angular Component Workshop

■ Wrapup: Input and Output

trivadis
makes **IT** easier. ■ ■ ■

16 10/17/2018 Angular Component Workshop

■ Summary

- Define the «API» of your component with Input / Output
- Request information with a ViewChild decorator or Template Reference Variable
- Getter / Setter can be used to notify user input changes

17 10/17/2018 Angular Component Workshop

Exercise

Create a new filter component under shared/
Move the code to the new filter component
Add Input for hitCount
If hitCount is 0 show a different message (eg."no matches found")
Notify parent component when filter has changed

18 10/17/2018 Angular Component Workshop

ViewChild and ViewChildren

Thomas Claudius Huber
Thomas Bandixen
Thomas Gassmann

BASLE • BERN • BRUGG • DÜSSELDORF • FRANKFURT A.M. • FREIBURG I.BR. • GENEVA
HAMBURG • COPENHAGEN • LAUSANNE • MUNICH • STUTTGART • VIENNA • ZURICH

trivadis
makes **IT** easier. ■ ■ ■

■ Use Cases

- A component may need to interact with or get information about a specific element or directive on a template
- Example: A component needs to set the focus on a specific element

■ Getting a Reference

- Javascript “old-school” way to access an element

```
let el = document.getElementById('myElId');
```

- In Angular we use the ViewChild decorator

```
@ViewChild('myEl') elementRef;
```

3 10/17/2018 Angular Component Workshop

■ ViewChild

- The selector can be an Angular Directive

```
@ViewChild(ngModel) filterInput: ngModel;
```

- Custom directives

```
@ViewChild(MyComponent) myComp: MyComponent;
```

- Template Reference Variable

```
@ViewChild('myEl') elementRef;
```

4 10/17/2018 Angular Component Workshop

■ ViewChild with Template Reference Variable

■ Template Reference Variable

```
@ViewChild('filterEl') filterEl;
```

■ Template

```
<input type="text" #filterEl [(ngModel)]="listFilter">
```

■ Use it on the AfterViewInit Lifecycle Hook. View has to be initialized and rendered first

```
ngAfterViewInit(): void {
    this.filterEl.nativeElement.focus();
}
```

5 10/17/2018 Angular Component Workshop

■ ViewChildren

■ Accessing multiple elements or directives on a Template

```
@ViewChildren('myEl') divElementRefs: QuerySelector<ElementRef>;
```

■ Tracks changes in the DOM

```
this.divElementRefs.changes.subscribe( () => { ... } );
```

■ Same selectors as ViewChild but can have a set of variables

```
@ViewChildren('myEl', 'nameEl')
divElementRefs: QuerySelector<ElementRef>;
```

6 10/17/2018 Angular Component Workshop

■ ViewChild and *ngIf

- When accessing an element inside *ngIf, it can be undefined
- Getter / Setter are a good solution
- Note: if subscribing inside the setter make sure to only subscribe once.
Example: hold the subscription inside a variable

7 10/17/2018 Angular Component Workshop

■ Summary

- ViewChild/Children provides a native element property
- Or provides a reference to the directive's data structures
- Only available after the AfterViewInit Lifecycle Hook
- It has to be inside the DOM to evaluate it

8 10/17/2018 Angular Component Workshop

Exercise

Add the focus on the search field with a Template Reference Variable and using the nativeElement

Communicating through a service

Thomas Claudius Huber
Thomas Bandixen
Thomas Gassmann

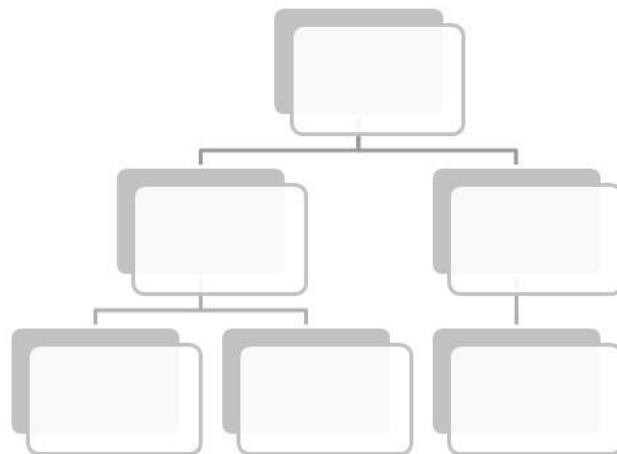

BASLE • BERN • BRUGG • DÜSSELDORF • FRANKFURT A.M. • FREIBURG I.BR. • GENEVA

trivadis
makes **IT** easier. ■ ■ ■

■ How do Services help the components

- Service as a box
- Temporarily store data
- To itself or to other components

■ Typical Angular Application

3 10/17/2018 Angular Component Workshop

trivadis
makes IT easier. ■ ■ ■

■ Typical Angular Application

4 10/17/2018 Angular Component Workshop

trivadis
makes IT easier. ■ ■ ■

■ What is State?

- View State
- User Information
- Entity Data
- User Selection and Input
- ...

5 10/17/2018 Angular Component Workshop

■ State Management

With a state management system we would like to have:

- A single-source of truth of our applications state and
- encapsulate our business logic from our view logic

6 10/17/2018 Angular Component Workshop

■ State Management

NgRx

State
Management with
Notifications

Basic State
Management

Property Bag

7 10/17/2018 Angular Component Workshop

trivadis
makes IT easier. ■ ■ ■

■ Property Bag

- A service with a property of values
- Service holds a bag of property values
- The component has getters and setters which interact directly with the service
- We always lose the properties from a component when we navigate away

8 10/17/2018 Angular Component Workshop

trivadis
makes IT easier. ■ ■ ■

■ Retain the search values

- Scenario: A user enters a search, navigates to details and returns back => the search term is gone.
- Can also be done by QueryParams. Normally the better way.
- However, what if the search is huge and complex?
- Property Bag Service is a good alternative to QueryParams

9 10/17/2018 Angular Component Workshop

■ Param Service

- A simple service

```
@Injectable()
export class ParamService {
  keyword: string;
}
```

- Component uses getter and setters

```
get listFilter() : string {
  return this.paramService.keyword;
}
set listFilter(value: string) : void {
  this.paramService.keyword = value;
}
```

10 10/17/2018 Angular Component Workshop

■ Services

- Provide functionality across components
Logging, Calculations, Data access, Data sharing, etc.
- Register it with the Angular Injector
- Inject into any component that needs it
- Normally, services are implemented as Singletons

11 10/17/2018 Angular Component Workshop

■ Service Scope and Lifetime

- Services can be registered on the component or module level
- Service scope: Defines which components can see and access the service
- The service lifetime depends on where the service is registered

12 10/17/2018 Angular Component Workshop

■ Register in a Component

- The service is available inside the component and all children
- If we register the service in different components (not child component) we get different instances

```
@Component({  
  templateUrl: 'employee-list.component.html',  
  providers: [ EmployeeService ]  
)  
export class EmployeeListComponent implements OnInit { ... }
```

13 10/17/2018 Angular Component Workshop

■ Register in a Module

- The service is available in every component in the application
- If registered in a lazy module it behaves differently. It is only available inside the module.

```
@NgModule({  
  imports: [ SharedModule, EmployeeRoutingModule ],  
  exports: [],  
  declarations: [...],  
  providers: [...fromServices.services]  
)  
export class EmployeeModule {}
```

14 10/17/2018 Angular Component Workshop

Demo

15 10/17/2018 Angular Component Workshop

trivadis
makes **IT** easier. ■ ■ ■

■ Summary: Property Bag

- Is great for retaining view state and user selections
- Also for sharing data and communicating state changes
- But any component can read the values and change it
- Components are only notified of state changes if they use template binding

16 10/17/2018 Angular Component Workshop

trivadis
makes **IT** easier. ■ ■ ■

■ State Management

NgRx

State
Management with
Notifications

Basic State
Management

Property Bag

17 10/17/2018 Angular Component Workshop

■ Basic State Management Service

- Retrieving Entity Data (CRUD)
- Provide state values
- Data does not change very often in the backend, so do not load it every time
- Data is stored locally
- Observe state changes

18 10/17/2018 Angular Component Workshop

■ Data Sharing Service

- Only load data the first time. Then use local instances

```
@Injectable()
export class EmployeeService {
  private employees: Employee[];

  constructor(private http: HttpClient) {}

  getEmployees() {}
  getEmployee(id: number) {}
  createEmployee(payload: Employee) {}
  ...
}
```

19 10/17/2018 Angular Component Workshop

■ Data Sharing Service: GetAll

- Only load data the first time. Then use local instances

```
getEmployees(): Observable<Employee[]> {
  if (this.employees) {
    return of(this.employees);
  }

  return this.http.get<Employee[]>(`URL`).pipe(
    tap(data => (this.employees = data)),
    catchError((error: any) => _throw(error))
  );
}
```

20 10/17/2018 Angular Component Workshop

■ Data Sharing Service: GetById

■ Get instance from local array

```
getEmployee(id: number): Observable<Employee> {
    if (this.employees) {
        const item = this.employees.find(e => e.id === id);
        if (item) {
            return of(item);
        }
    }
    return this.http.get<Employee>(`URL`)
        .pipe(catchError((error: any) => _throw(error)));
}
```

21 10/17/2018 Angular Component Workshop

■ Data Sharing Service: Create

■ Add it to the list if no error occurs

```
createEmployee(payload: Employee): Observable<Employee> {
    return this.http.post<Employee>(`URL`, payload)
        .pipe(
            tap(data => this.employees.push(data)),
            catchError((error: any) => _throw(error))
        );
}
```

22 10/17/2018 Angular Component Workshop

■ Data Sharing Service: Delete

■ Delete locally if no error occurs

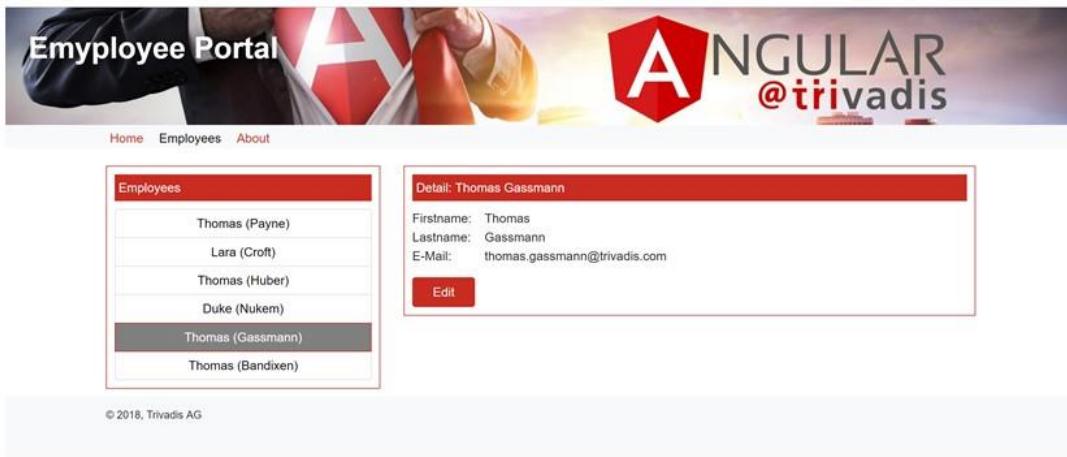

```
removeEmployee(payload: Employee): Observable<any> {
    return this.http.delete<any>(`URL`).pipe(
        tap(data => {
            const idx = this.employees.findIndex(e => e.id ===
                payload.id);

            if (idx >= 0) {
                this.employees.splice(idx, 1);
            }
        }),
        catchError((error: any) => _throw(error))
    );
}
```

23 10/17/2018 Angular Component Workshop

■ Keeping State in Sync

A screenshot of a web application titled "Employee Portal". The header features a large red "A" logo and the text "ANGULAR @trivadis". The navigation bar includes links for "Home", "Employees", and "About".

On the left, there is a sidebar with a red header labeled "Employees". It contains a list of names: Thomas (Payne), Lara (Croft), Thomas (Huber), Duke (Nukem), Thomas (Gassmann) (which is highlighted in a dark gray box), and Thomas (Bandixen).

On the right, there is a main content area with a red header labeled "Detail: Thomas Gassmann". It displays the following information:
Firstname: Thomas
Lastname: Gassmann
E-Mail: thomas.gassmann@trivadis.com

A red "Edit" button is located at the bottom of this section.

At the bottom left of the page, there is a copyright notice: "© 2018, Trivadis AG".

24 10/17/2018 Angular Component Workshop

■ Track Selected Employee

- A property with the selected employee.

```
@Injectable()  
export class EmployeeService {  
    private employees: Employee[];  
    public currentEmployee: Employee | null;  
    ...  
}
```

25 10/17/2018 Angular Component Workshop

■ Track Selected Employee

- A property with the selected product

```
onSelected(employee: Employee) {  
    this.employeeService.currentEmployee = employee;  
}
```

26 10/17/2018 Angular Component Workshop

■ Get Selected Employee

- Notify detail about the selected employee. A simple property does not work. For change detection a getter is appropriate. If everything is properly bound, it works automatically (pull).

```
@Component({  
    templateUrl: 'employee-detail.component.html',  
})  
export class EmployeeDetailComponent implements OnInit {  
    get employee(): Employee | null {  
        return this.employeService.currentEmployee;  
    }  
    ...  
}
```

27 10/17/2018 Angular Component Workshop

Demo

28 10/17/2018 Angular Component Workshop

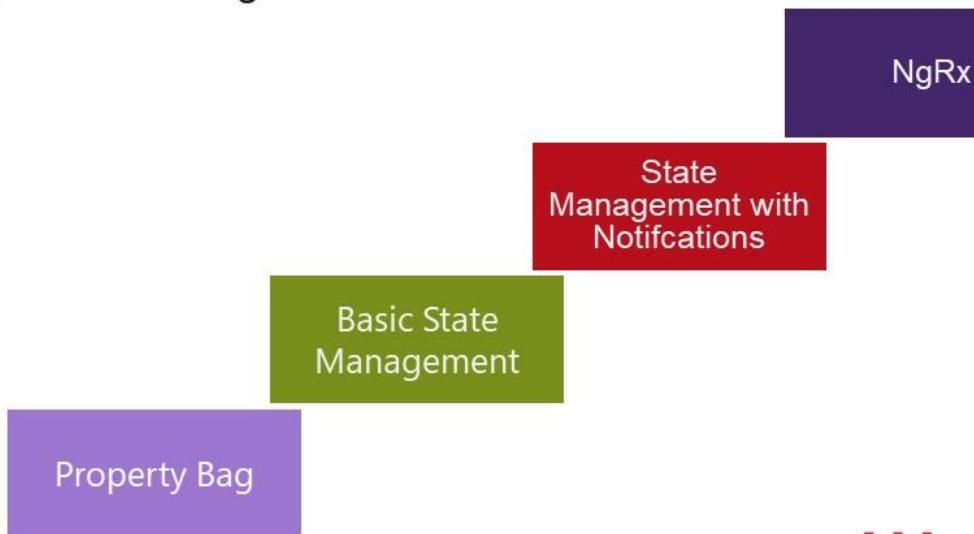

■ Summary: Basic State Management

- State Management Service for retrieving, managing and storing state
- Share between components
- Retains and shares state values
- Minimizes hits to the backend server
- Provides changes notifications for bound values using a getter
- No explicit change notification
- State is not immutable

29 10/17/2018 Angular Component Workshop

■ State Management

30 10/17/2018 Angular Component Workshop

■ State Management with Notifications

- Add notifications to the service
- Broadcasting service notifications
- EventEmitter is similar but not recommended
- Can be done with Subjects
- Or with BehaviorSubjects

31 10/17/2018 Angular Component Workshop

■ Subject

- The key purpose is to send out notifications
- Is a special type of an observable which can multicast an event to multiple subscribers
- It is also an observer

```
this.mySubject.next(item);
```

32 10/17/2018 Angular Component Workshop

■ Use the Subject

■ Change the onSelected method

```
onSelected(employee: Employee) {  
    this.employeeService.changeSelectedEmployee(employee);  
}
```

■ Expose only the readonly observable

```
private selectedEmployeeSource = new Subject<Employee>();  
selectedEmployeeChanges$ =  
    this.selectedEmployeeSource.asObservable();
```

33 10/17/2018 Angular Component Workshop

■ Use the Subject

■ Now we can subscribe to the observable

```
this.employeeService.selectedEmployeeChanges$.subscribe(  
    selectedEmpl => this.employee = selectedEmpl;  
) ;
```

34 10/17/2018 Angular Component Workshop

Demo

trivadis
makes **IT** easier. ■ ■ ■

35 10/17/2018 Angular Component Workshop

■ BehaviorSubject

- When subscribing to a BehaviorSubject, you get the last value of the chain
- Everything else is exactly as with a regular Subject

```
private selectedEmpSource = new BehaviorSubject<Employee>(null);  
selectedEmployeeChanges$ =  
    this.selectedEmpSource.asObservable();
```

trivadis
makes **IT** easier. ■ ■ ■

36 10/17/2018 Angular Component Workshop

■ Cleaning up Subscriptions

- To prevent memory leaks, we should unsubscribe from the observable if we are finished using it.

```
private sub: Subscription;

ngOnInit() {
  this.sub = this.selectedEmployeeChanges$.subscribe(empl =>
    (this.employees = empl)
  );
}
ngOnDestroy(): void {
  this.sub.unsubscribe();
}
```

37 10/17/2018 Angular Component Workshop

Demo

38 10/17/2018 Angular Component Workshop

■ Summary: State Management with Notifications

- Use Subject when notifications are more than just changes to bound properties
- It does not need a subject if notifications are not required
- Especially not if notifications are only for changes to bound properties
- Use Subject if there is no initial value

39 10/17/2018 Angular Component Workshop

Exercise

Add a ParamService for the employee-list.component.ts (Property Bag)

Add a basic state management service and use it with employee-shell.comoponent.ts

Change it to use a Subject or BehaviorSubject

40 10/17/2018 Angular Component Workshop

Component Architecture

3 10/17/2018 Angular Component Workshop

trivadis
makes **IT** easier. ■ ■ ■

■ Component Architecture

4 10/17/2018 Angular Component Workshop

trivadis
makes **IT** easier. ■ ■ ■

■ Advanced component architecture

Containers

- State-full Components
- Aware of State
- Read data from state/store
- Dispatch Actions

Presentational

- State-less Components
- Not aware of State
- Read data from @Input
- Callbacks via @Output

5 10/17/2018 Angular Component Workshop

■ ChangeDetectionStrategy.OnPush

- OnPush means that the change detector's mode will be initially set to CheckOnce
- Angular only perform ChangeDetection if the reference of the input changes
- For our presentational components we can set ChangeDetectionStrategy to OnPush
Because we fetch our data through an @Input
- For our container components we can also set ChangeDetectionStrategy to OnPush **if** we load everything via an Observable and async pipe.

6 10/17/2018 Angular Component Workshop

■ ChangeDetectionStrategy.OnPush

- Inside our component decorator

```
@Component({  
    selector: 'app-employee-form',  
    ...  
    changeDetection: ChangeDetectionStrategy.OnPush  
})
```

7 10/17/2018 Angular Component Workshop

Demo/Excercise

Check the concept of the employee-form
Add OnPush to the specific components

makes **IT** easier. ■ ■ ■

■ Angular Elements

«Angular is ideal for building **complete applications**, and our tooling, documentation and infrastructure are primarily aimed at this case.»

Rob Wormald, Angular Team

trivadis
makes **IT** easier. ■ ■ ■

■ Overview

3 10/17/2018 Angular Component Workshop

■ Angular Elements

«[...] but it's quite challenging to use in scenarios that don't fit that specific Single Page Application model.»

Rob Wormald, Angular Team

4 10/17/2018 Angular Component Workshop

■ Use Cases

- Enhancing existing HTML Pages
- Content Management Systems
- Use components in other environments or frameworks
- Microfrontends
- Reuse components across teams

5 10/17/2018 Angular Component Workshop

The screenshot shows a web browser displaying the Angular documentation at <https://next.angular.io/guide/reactive-forms>. The page has a red header with the Angular logo and navigation links for Features, Docs, Resources, Events, and Blog. A search bar and social media icons are also present. The main content area is titled "Add a FormGroup". It explains how to register multiple form controls within a parent FormGroup and provides code snippets for hero-detail.component.ts:

```
src/app/hero-detail/hero-detail.component.ts
import { Component } from '@angular/core';
import { FormControl, FormGroup } from '@angular/forms';
```

In the class, wrap the FormControl in a FormGroup called heroForm as follows:

```
src/app/hero-detail/hero-detail.component.ts
export class HeroDetailComponent2 {
  heroForm = new FormGroup ({
    name: new FormControl()
  });
}
```

Now that you've made changes in the class, they need to be reflected in the template. Update hero-detail.component.html by replacing it with the following:

The sidebar on the right lists other topics under "Reactive Forms", including Introduction to Reactive Forms, Reactive forms, Template-driven forms, Async vs. sync, Choosing reactive or template-driven forms, Setup, Create a data model, Create a reactive forms component, Create the template, Import the ReactiveFormsModule, Display the HeroDetailComponent, Essential form classes, Style the app, and Add a FormGroup.

■ Web Components

Web Components are a set of features added by the W3C

- **HTML Template:** Template of the HTML
- **Shadow DOM:** DOM and style encapsulation
- **HTML Imports:** Imports in HTML
- **Custom Elements:** Ability to add to the HTML vocabulary

■ Custom Elements

Custom elements share the same API surface as native DOM objects:

- **Attributes**
- **Properties**
- **Methods**
- **Events**

■ Custom Elements

- Create and define a Custom Element
- Custom elements are **HTMLUnknownElement** until upgraded

```
class myElement extends HTMLElement {  
    ...  
}  
  
customElements.define('my-element', myElement);
```

9 10/17/2018 Angular Component Workshop

■ Custom Elements: Reactions

```
class myElement extends HTMLElement {  
  
    connectedCallback() {  
        ...  
    }  
    disconnectedCallback() {  
        ...  
    }  
}
```

10 10/17/2018 Angular Component Workshop

■ Custom Elements: Attributes

```
class myElement extends HTMLElement {  
    static get observedAttributes() {  
        return ['country'];  
    }  
  
    attributeChangedCallback(name, oldValue, newValue) {  
        if (name === 'country') {  
            // do something with newValue  
        }  
    }  
}
```

■ Can be used as follows:

```
<app-matches-by-country country="sui"></app-matches-by-country>
```

11 10/17/2018 Angular Component Workshop

■ Custom Elements: Properties

```
class myElement extends HTMLElement {  
    get country() {  
        return this.getAttribute('country');  
    }  
  
    set country(val) {  
        this.setAttribute('country', val);  
    }  
}
```

■ Can be used as follows:

```
let matches = document.querySelector('app-matches-by-country');  
matches.country = 'ger';
```

12 10/17/2018 Angular Component Workshop

■ Custom Elements: Custom Events

```
class myElement extends HTMLElement {  
  
    emitCountryChange() {  
        this.dispatchEvent(  
            new CustomEvent('country-change', {  
                detail: this.country  
            }));  
    }  
}
```

- Can be used as follows:

```
let matches = document.querySelector('app-matches-by-country');  
matches.addEventListener('country-change', event => { ... });
```

13 10/17/2018 Angular Component Workshop

■ Custom Elements in Angular

- Angular has been designed for this

```
<app-matches-by-country  
    [country]="sui"  
    (countryChanged)="foobar($event)"  
>  
</app-matches-by-country>
```

14 10/17/2018 Angular Component Workshop

■ Enter Angular Elements

- Provides a bridge from angular concepts to web components.

■ @HostBinding()	=>	Attributes
■ @Input()	=>	Properties
■ @Output()	=>	CustomEvents
■ Lifecycle Hooks	=>	Reactions

■ Create our first Angular Element

- Update Angular CLI (> Version 6).
- Create new project
- ng add @angular/elements
- ng g c matchesByCountry -v Native

■ Update Polyfill

- Add useful polyfill

```
npm install @webcomponents/custom-elements --save
```

- Add polyfill to polyfill.ts

```
/* CUSTOM ELEMENTS */  
// Used for browsers with partially native support of CE  
import '@webcomponents/custom-elements/src/native-shim';  
  
// Used for browsers without a native support of Custom Elements  
import '@webcomponents/custom-elements/custom-elements.min';
```

17 10/17/2018 Angular Component Workshop

■ Update Module

- Add Component to entryComponents

- Remove bootstrap Array.

```
@NgModule({  
    imports: [BrowserModule, BrowserAnimationsModule,  
             HttpClientModule, MatCardModule],  
    declarations: [AppComponent, MatchesByCountryComponent],  
    providers: [],  
    entryComponents: [MatchesByCountryComponent]  
})  
export class AppModule {  
    ...  
}
```

18 10/17/2018 Angular Component Workshop

■ Update Module

- Add ngDoBootstrap Method to body of class. This means to start the module but not render any component

```
@NgModule({ ... })
export class AppModule {
    constructor(private injector: Injector) {}

    ngDoBootstrap () {
        const el1 = createCustomElement(MatchesByCountryComponent,
            { injector: this.injector });
        customElements.define('app-matches-by-country', el1);
    }
}
```

19 10/17/2018 Angular Component Workshop

■ Use Angular Element

- Add new HTML Tag to index.html

```
...
<body>
    <app-matches-by-country country="SUI"></app-matches-by-country>
</body>
...
```

- Run the application and see your Angular Element Component in action

20 10/17/2018 Angular Component Workshop

■ Use Angular Element

■ Add HTML Tag by Javascript

```
const matchesToday = document.createElement('app-matches-today');  
document.body.appendChild(matchesToday);  
matchesToday.country = 'SUI';  
matchesToday.setAttribute('country', 'GER');
```

■ Or by Custom Element API

```
const MatchToday = document.get('app-matches-today');  
const matchToday = new MatchToday();  
// or  
const matchToday = new MatchToday(differencInjector);
```

21 10/17/2018 Angular Component Workshop

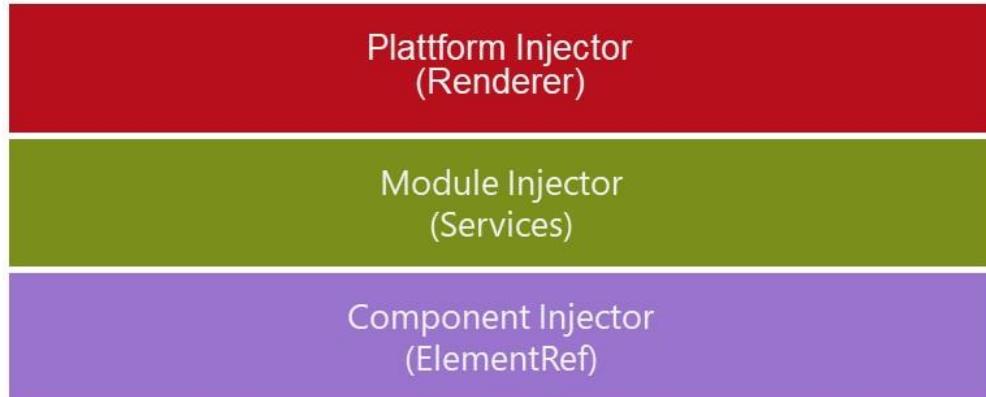

Demo

22 10/17/2018 Angular Component Workshop

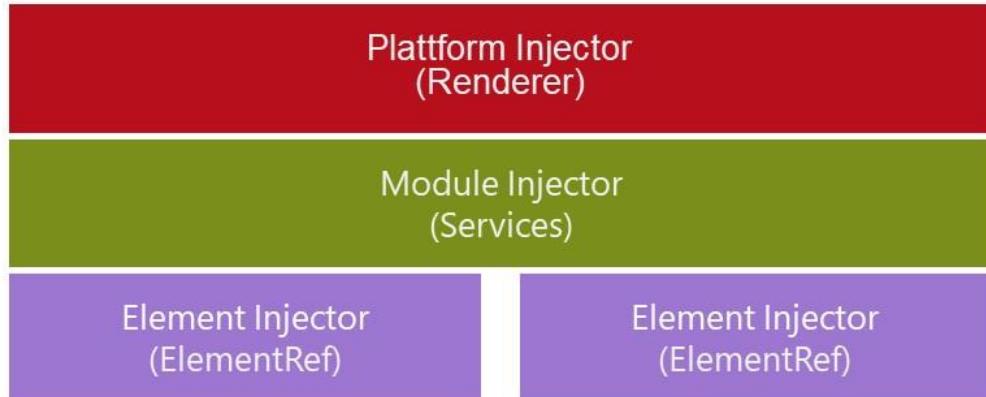

■ Dependency Injection

23 10/17/2018 Angular Component Workshop

■ Dependency Injection

24 10/17/2018 Angular Component Workshop

■ Module

```
@NgModule({ ... })
export class AppModule {
    constructor(private injector: Injector) {}

    ngDoBootstrap () {
        const ell = createCustomElement(MatchesByCountryComponent,
            { injector: this.injector });
        customElements.define('app-matches-by-country', ell);
    }
}
```

25 10/17/2018 Angular Component Workshop

■ Dependency Injection Works

26 10/17/2018 Angular Component Workshop

■ Content Projection

```
<app-test>
  <span>Hallo Angular Workshop</span>
</app-test>

@Component({
  selector: 'app-test',
  template: `
    <ng-content></ng-content>
  `
})
export class TestComponent {
```

27 10/17/2018 Angular Component Workshop

■ Shadow DOM

- There are three ways of encapsulation
 - Emulated
Styling from page has impact to component but not vice versa
 - Native / ShadowDom
Styling from page has no impact to component
 - None
Styling from component can impact the styling from the page

```
@Component({ ...
  encapsulation: ViewEncapsulation.ShadowDom
})
export class MatchesTodayComponent implements OnInit { ... }
```

28 10/17/2018 Angular Component Workshop

Demo

trivadis
makes **IT** easier. ■ ■ ■

29 10/17/2018 Angular Component Workshop

■ Build your component and pack it

- Install **concat** and **fs-extra**
- Add script command and build-elements.js

```
"build:elements": "ng build --prod --output-hashing none && node  
build-elements.js"
```

- Run the following command

```
npm run build:elements
```

- Open demo/index.html to see it in action

trivadis
makes **IT** easier. ■ ■ ■

30 10/17/2018 Angular Component Workshop

■ build-elements.js

```
const fs = require('fs-extra');
const concat = require('concat');

(async function build() {
  const files = [
    './dist/WorldCupComponent/runtime.js',
    './dist/WorldCupComponent/polyfills.js',
    './dist/WorldCupComponent/main.js'
  ];

  await fs.ensureDir('elements');
  await concat(files, 'elements/world-cup.js');
  console.info('Wold Cup Element created successfully!');
})();
```

31 10/17/2018 Angular Component Workshop

■ Angular Elements in V6

- It is just the beginning
- Size is too big for shipping in non Angular projects
- Will be much better with Ivy (V7)
- Will be much easier with V7
- Browser Support.

32 10/17/2018 Angular Component Workshop

Demo/Exercise

Create an Angular Element component

Use it outside of Angular
